

Southern Graphite Corridors Study

Mineral: Graphite

Region: Lindi

Generated: 04 July 2026 · Terra Meta Mineral Intelligence Platform

Overview

Graphite flake distribution and host-rock mapping in southern coastal belts.

Executive summary

Southern Tanzania hosts multiple graphite-bearing metasedimentary packages with medium-to-coarse flake potential. This report maps corridor continuity and compares grade proxies from regional sampling campaigns.

Key findings

- Two continuous corridors exceed 12 km strike length each.
- Host gneiss packages show favorable metamorphic grade for coarse flake.
- Port proximity gives southern blocks a logistics advantage over inland targets.

This report is part of the Terra Meta prospectivity catalog. Data and interpretations support exploration planning and due diligence; verify critical decisions with licensed geological survey and field work.
